## 1ST STARTING OF C.H. BOILER FUWI

- 1. Removing two screws from 8- modular switchgear.
- 2. Checking correctness connections AC power, supply of feeder, sensors: temperature feeder, boiler temperature, ZTK.
- 3. Checking correctness connections cable 7 wires wires: PE, 1,2 blower, 3,4 photodiode, 5,6 lighter.
- 4. Removing sensors, power pumps, hot water and / or CO (3-core cable), power four-way or three-way valve on the side bar.
- 5. Top rail controller:
  - Connection of hot water sensor (<u>Tcwu pin 2,3</u>)
  - Connection of central heating (Tco pin 8,9)
  - Connection of return sensor (Tpow pin 10,11)

Sensors Tco i Tpow CONNECT WHEN IS USED THREE-WAY FOUR AND FOUR-WAY VALVE.

- 6. Connect with 3-core cable of Co and CWU pumps (ex ample connection pump for below contro ller)
  - Pin 3 hor water pump
  - Pin 4 central heating pump

7. Connect 3-way Or 4-way valve (lower bar controller - pin 1,2)

M0 - Valve closing

M1 - Valve opening

- 8. Place the sensor on the installation:
  - Tcwu on hot water heater
  - Tco on output boiler
  - Tpow on return of boiler
- 9. Check the correct connections and start the c.h. boiler.
- 10. On Menu -> Measurements check, when temperature is displayed. If instead the temperature is <u>ERR</u>, although sensors are connected, that is mean that, this is incorrect connection of sensors.
- 11. We are setting every c.h. boiler parameters: c.h. boiler temperature, hot water temperature, minima pump temperature, feeding and bower.

| BOILER POWER [KW]                        | 9  | 15 | 22 | 30 | 44 | 55 | 80 | 100 |
|--|--|----|----|----|----|----|----|-----|
| BURNER POWER N 0 2<br>(100%) FEEDING [S] | 5  | 7  | 10 | 16 | 22 | 12 | 20 | 24  |
| BURNER POWER N 01<br>FEEDING [S]         | From 30% up to 100% of feeding time of burner power No 2 |    |    |    |    |    |    |     |

- 12. Star the boiler and make first fire up the boiler.
- 13. At the first pre-spammed, check (shine a flashlight) if Filling is too much fuel (is unloaded), reduce the initial charge in the service mode.
- 14. Check the the proper operation of all equipment and automation in the "test outputs" (investigation to setting temperature, switching up and and removable pumps and 3-way and 4-way valves).
